Abstract

The Concise Guide to PHARMACOLOGY 2017/18 provides concise overviews of the key properties of nearly 1800 human drug targets with an emphasis on selective pharmacology (where available), plus links to an open access knowledgebase of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties. Although the Concise Guide represents approximately 400 pages, the material presented is substantially reduced compared to information and links presented on the website. It provides a permanent, citable, point-in-time record that will survive database updates. The full contents of this section can be found at <http://online.bjppharmacology.org/doi/10.1111/bjpph.13876/full>. Catalytic receptors are one of the eight major pharmacological targets into which the Guide is divided, with the others being: G protein-coupled receptors, ligand-gated ion channels, voltage-gated ion channels, other ion channels, nuclear hormone receptors, enzymes and transporters. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. The landscape format of the Concise Guide is designed to facilitate comparison of related targets from material contemporary to mid-2017, and superseded data presented in the 2015/16 and 2013/14 Concise Guides and previous Guides to Receptors and Channels. It is produced in close conjunction with the Nomenclature Committee of the Union of Basic and Clinical Pharmacology (NC-IUPHAR), therefore, providing official IUPHAR classification and nomenclature for human drug targets, where appropriate.

Conflict of interest

The authors state that there are no conflicts of interest to declare.

Overview: Catalytic receptors are cell-surface proteins, usually dimeric in nature, which encompass ligand binding and functional domains in one polypeptide chain. The ligand binding domain is placed on the extracellular surface of the plasma membrane and separated from the functional domain by a single transmembrane-spanning domain of 20–25 hydrophobic amino acids. The functional domain on the intracellular face of the

plasma membrane has catalytic activity, or interacts with particular enzymes, giving the superfamily of receptors its name. Endogenous agonists of the catalytic receptor superfamily are peptides or proteins, the binding of which may induce dimerization of the receptor, which is the functional version of the receptor.

Amongst the catalytic receptors, particular subfamilies may be readily identified dependent on the function of the enzymatic

portion of the receptor. The smallest group is the particulate guanylyl cyclases of the natriuretic peptide receptor family. The most widely recognized group is probably the receptor tyrosine kinase (RTK) family, epitomized by the neurotrophin receptor family, where a crucial initial step is the activation of a signalling cascade by autophosphorylation of the receptor on intracellular tyrosine residue(s) catalyzed by enzyme activity intrinsic to the

receptor. A third group is the extrinsic protein tyrosine kinase receptors, where the catalytic activity resides in a separate protein from the binding site. Examples of this group include the GDNF and EphB receptor families, where one, catalytically silent, member of the heterodimer is activated upon binding the ligand, causing the second member of the heterodimer, lacking

ligand binding capacity, to initiate signaling through tyrosine phosphorylation. A fourth group, the receptor threonine/serine kinase (RTSK) family, exemplified by TGF- β and BMP receptors, has intrinsic serine/threonine protein kinase activity in the heterodimeric functional unit. A fifth group is the receptor tyrosine phosphatases (RTP), which appear to lack cognate ligands, but

may be triggered by events such as cell:cell contact and have identified roles in the skeletal, hematopoietic and immune systems. A further group of catalytic receptors for the Guide is the integrins, which have roles in cell:cell communication, often associated with signaling in the blood.

Cytokine receptor family

Catalytic receptors → Cytokine receptor family

Overview: Cytokines are not a clearly defined group of agents, other than having an impact on immune signalling pathways, although many cytokines have effects on other systems, such as in development. A feature of some cytokines, which allows them to be distinguished from hormones, is that they may be produced by non-secretory cells, for example, endothelial cells. Within the cytokine receptor family, some subfamilies may be identified, which are described elsewhere in the Guide to PHARMACOLOGY, receptors for the **TNF family**, the **TGF- β family** and the **chemokines**. Within this group of records are described Type I

cytokine receptors, typified by interleukin receptors, and Type II cytokine receptors, exemplified by interferon receptors. These receptors possess a conserved extracellular region, known as the cytokine receptor homology domain (CHD), along with a range of other structural modules, including extracellular immunoglobulin (Ig)-like and fibronectin type III (FBNIII)-like domains, a transmembrane domain, and intracellular homology domains. An unusual feature of this group of agents is the existence of soluble and decoy receptors. These bind cytokines without allowing signalling to occur. A further attribute is the production of endoge-

nous antagonist molecules, which bind to the receptors selectively and prevent signalling. A commonality of these families of receptors is the ligand-induced homo- or hetero-oligomerisation, which results in the recruitment of intracellular protein partners to evoke cellular responses, particularly in inflammatory or haematopoietic signalling. Although not an exclusive signalling pathway, a common feature of the majority of cytokine receptors is activation of the JAK/STAT pathway. This cascade is based around the protein tyrosine kinase activity of the Janus kinases (JAK), which phosphorylate the receptor and thereby facilitate the recruitment of signal

transducers and activators of transcription (STATs). The activated homo- or heterodimeric STATs function principally as transcription factors in the nucleus.

Type I cytokine receptors are characterized by two pairs of conserved cysteines linked via disulfide bonds and a C-terminal

WSXWS motif within their CHD. Type I receptors are commonly

classified into five groups, based on sequence and structural homology of the receptor and its cytokine ligand, which is potentially more reflective of evolutionary relationships than an earlier scheme based on the use of common signal transducing chains

within a receptor complex.

Type II cytokine receptors also have two pairs of conserved cysteines but with a different arrangement to Type I and also lack the WSXWS motif.

IL-2 receptor family

Catalytic receptors → Cytokine receptor family → IL-2 receptor family

Overview: The IL-2 receptor family consists of one or more ligand-selective subunits, and a common γ chain (γ C): *IL2RG*, *P31785*), though IL-4 and IL-7 receptors can form complexes with other receptor chains. Receptors of this family associate with Jak1 and Jak3, primarily activating Stat5, although certain family members can also activate Stat1, Stat3, or Stat6. Ro264550 has been described as a selective IL-2 receptor antagonist, which binds to IL-2 [204].

Nomenclature	Interleukin-2 receptor	Interleukin-4 receptor type I	Interleukin-4 receptor type II	Interleukin-7 receptor	Interleukin-9 receptor
Subunits	Interleukin-2 receptor subunit β (Ligand-binding subunit), Interleukin-2 receptor subunit γ (Other subunit), Interleukin-2 receptor subunit α (Ligand-binding subunit)	Interleukin-4 receptor subunit α (Ligand-binding subunit), Interleukin-2 receptor subunit γ (Other subunit)	Interleukin-13 receptor subunit $\alpha 1$ (Other subunit), Interleukin-4 receptor subunit α (Ligand-binding subunit)	Interleukin-2 receptor subunit γ (Other subunit), Interleukin-7 receptor subunit α (Ligand-binding subunit)	Interleukin-2 receptor subunit γ (Other subunit), Interleukin 9 receptor (Ligand-binding subunit)

IL-3 receptor family

Catalytic receptors → Cytokine receptor family → IL-3 receptor family

Overview: The IL-3 receptor family signal through a receptor complex comprising of a ligand-specific α subunit and a common β chain (CSF2RB, P32927), which is associated with Jak2 and signals primarily through Stat5.

Nomenclature	Interleukin-3 receptor	Interleukin-5 receptor	Granulocyte macrophage colony-stimulating factor receptor
Subunits	Interleukin 3 receptor, α subunit (ligand-binding subunit), Cytokine receptor common β subunit (Other subunit)	Interleukin 5 receptor, α subunit (ligand-binding subunit), Cytokine receptor common β subunit (Other subunit)	GM-CSF receptor, α subunit (ligand-binding subunit), Cytokine receptor common β subunit (Other subunit)
Endogenous agonists	IL-3 (IL3, P08700)	IL-5 (IL5, P05113)	G-CSF (CSF3, P09919), GM-CSF (CSF2, P04141)
Selective antagonists	–	YM90709 [134]	–

Subunits

Nomenclature	Interleukin 3 receptor, α subunit	Interleukin 5 receptor, α subunit	GM-CSF receptor, α subunit	Cytokine receptor common β subunit
HGNC, UniProt	IL3RA, P26951	IL5RA, Q01344	CSF2RA, P15509	CSF2RB, P32927

Antibodies	–	bemralizumab (pK _d 8.7) [109]	mavrilimumab (pIC ₅₀ 9.9) [32]	–

IL-6 receptor family

Catalytic receptors → Cytokine receptor family → IL-6 receptor family

Overview: The IL-6 receptor family signal through a ternary receptor complex consisting of the cognate receptor and either the IL-6 signal transducer gp130 (*IL6ST*, *P40189*) or the oncostatin M-specific receptor, β subunit (*OSMR*, *Q99650*), which then activates the JAK/STAT, Ras/Raf/MAPK and PI 3-kinase/PKB signalling modules. Unusually amongst the cytokine receptors, the CNTF receptor is a glycerophosphatidylinositol-linked protein.

Nomenclature	Interleukin-6 receptor	Interleukin-11 receptor	Interleukin-27 receptor	Interleukin-31 receptor	Ciliary neurotrophic factor receptor	Leukemia inhibitory factor receptor	Oncostatin-M receptor
Subunits	Interleukin-6 receptor, α subunit, Interleukin-6 receptor, β subunit (Other subunit)	Interleukin-11 receptor, α subunit (Ligand-binding subunit), Interleukin-6 receptor, β subunit (Other subunit)	Interleukin-6 receptor, β subunit (Other subunit), Interleukin 27 receptor, alpha (Ligand-binding subunit)	Interleukin-31 receptor, α subunit (Ligand-binding subunit), Oncostatin M-specific receptor, β subunit (Other subunit)	Leukemia inhibitory factor receptor (Other subunit), Interleukin-6 receptor, β subunit, Ciliary neurotrophic factor receptor α subunit (Ligand-binding subunit)	Leukemia inhibitory factor receptor (Ligand-binding subunit), Interleukin-6 receptor, β subunit (Other subunit)	Interleukin-6 receptor, β subunit (Other subunit), Oncostatin M-specific receptor, β subunit (Ligand-binding subunit)
Endogenous agonists	IL-6 (<i>IL6</i> , P05231) [157]	IL-11 (<i>IL11</i> , P20809)	IL-27 (<i>EBI3</i> , <i>IL27</i> , Q14213 Q8NEV9)	IL-31 (<i>IL31</i> , Q6EBC2)	CRCF1/CLCF1 heterodimer (CLCF1 <i>CRLF1</i> , O75462 Q9UBD9), ciliary neurotrophic factor (<i>CNTF</i> , P26441)	ILF (<i>ILF</i> , P15018), cardiotrophin-1 (<i>CTF1</i> , Q16619), oncostatin M (<i>OSM</i> , P13725)	oncostatin M (<i>OSM</i> , P13725)

IL-12 receptor family

Catalytic receptors → Cytokine receptor family → IL-12 receptor family

Overview: IL-12 receptors are a subfamily of the IL-6 receptor family. IL12RB1 is shared between receptors for IL-12 and IL-23; the functional agonist at IL-12 receptors is a heterodimer of IL-12A/IL-12B, while that for IL-23 receptors is a heterodimer of IL-12B/IL-23A.

Nomenclature	Interleukin-12 receptor	Interleukin-23 receptor	Interleukin-12 receptor, β 1 subunit	Interleukin-12 receptor, β 2 subunit	Interleukin 23 receptor
HGNC, UniProt	–	–	<i>IL12RB1</i> , P42701	<i>IL12RB2</i> , Q99665	<i>IL23R</i> , Q5VWK5
Subunits	Interleukin-12 receptor, β 2 subunit (Other subunit), Interleukin-12 receptor, β 1 subunit (Ligand-binding subunit)	Interleukin 23 receptor (Ligand-binding subunit), Interleukin-12 receptor, β 1 subunit (Ligand-binding subunit)	–	–	–

Prolactin receptor family

Catalytic receptors → Cytokine receptor family → Prolactin receptor family

Overview: Prolactin family receptors form homodimers in the presence of their respective ligands, associate exclusively with Jak2 and signal via Stat5.

Nomenclature	Erythropoietin receptor	Granulocyte colony-stimulating factor receptor	Growth hormone receptor	Prolactin receptor	Thrombopoietin receptor
HGNC, UniProt	<i>EPOR</i> , P19235	<i>CSF3R</i> , Q99062	<i>GHR</i> , P10912	<i>PRLR</i> , P16471	<i>MPL</i> , P40238
Endogenous agonists	erythropoietin (<i>EPO</i> , P01588) [44]	G-CSF (<i>CSF3</i> , P09919)	growth hormone 1 (<i>GHI</i> , P01241), growth hormone 2 (<i>GH2</i> , P01242)	prolactin (<i>PRL</i> , P01236) [46] – Mouse, chorionamniotropin (<i>CSH1</i> , <i>CSH2</i> , P01243), chorionic somatomammotropin hormone-like 1 (<i>CSHL1</i> , Q14406)	thrombopoietin (<i>THPO</i> , P40225)
Agonists	peginesatide [44]	pegfilgrastim	–	–	romiplostin
Selective agonists	–	–	–	–	eltrombopag [119]

Interferon receptor family

Catalytic receptors → Cytokine receptor family → Interferon receptor family

Overview: The interferon receptor family includes receptors for type I (α , β , κ and ω) and type II (γ) interferons. There are at least 13 different genes encoding IFN- α subunits in a cluster on human chromosome 9p22: $\alpha 1$ (*IFNA1*, P01562), $\alpha 2$ (*IFNA2*, P01563), $\alpha 4$ (*IFNA4*, P05014), $\alpha 5$ (*IFNA5*, P01569), $\alpha 6$ (*IFNA6*, P05013), $\alpha 7$ (*IFNA7*, P01567), $\alpha 8$ (*IFNA8*, P32881), $\alpha 10$ (*IFNA10*, P01566), $\alpha 13$ (*IFNA13*, P01562), $\alpha 14$ (*IFNA14*, P01570), $\alpha 16$ (*IFNA16*, P05015), $\alpha 17$ (*IFNA17*, P01571) and $\alpha 21$ (*IFNA21*, P01568).

Nomenclature	Interferon- α/β receptor	Interferon- γ receptor
Subunits	Interferon α/β receptor 2 (Other subunit), interferon α/β receptor 1 (Ligand-binding subunit)	Interferon γ receptor 2 (Other subunit), Interferon γ receptor 1 (Ligand-binding subunit)
Endogenous agonists	IFN- $\alpha 1/13$ (<i>IFNA1</i> , P01562), IFN- $\alpha 10$ (<i>IFNA10</i> , P01566), IFN- $\alpha 14$ (<i>IFNA14</i> , P01570), IFN- $\alpha 16$ (<i>IFNA16</i> , P05015), IFN- $\alpha 17$ (<i>IFNA17</i> , P01571), IFN- $\alpha 2$ (<i>IFNA2</i> , P01563), IFN- $\alpha 21$ (<i>IFNA21</i> , P01568), IFN- $\alpha 4$ (<i>IFNA4</i> , P05014), IFN- $\alpha 5$ (<i>IFNA5</i> , P001569), IFN- $\alpha 6$ (<i>IFNA6</i> , P05013), IFN- $\alpha 7$ (<i>IFNA7</i> , P01567), IFN- $\alpha 8$ (<i>IFNA8</i> , P32881), IFN- β (<i>IFNB1</i> , P01574), IFN- κ (<i>IFNK</i> , Q9P0W0), IFN- ω (<i>IFNW1</i> , P05000)	IFN- γ (<i>IFNG</i> , P01579)
Selective agonists	peginterferon alfa-2b [191]	–

Subunits

Nomenclature	interferon α/β receptor 1	Interferon α/β receptor 2	Interferon γ receptor 1	Interferon γ receptor 2
HGNC, UniProt	<i>IFNA1</i> , P17181	<i>IFNAR2</i> , P48551	<i>IFNGR1</i> , P15260	<i>IFNGR2</i> , P38484

IL-10 receptor family

Catalytic receptors → Cytokine receptor family → IL-10 receptor family

Overview: The IL-10 family of receptors are heterodimeric combinations of family members: IL10RA/IL10RB responds to IL-10; IL20RA/IL20RB responds to IL-19, IL-20 and IL-24; IL22RA1/IL20RB responds to IL-20 and IL-24; IL22RA1/IL10RB responds to IL-22; IFNLR1 (previously known as IL28RA)/IL10RB responds to IFN- λ 1, - λ 2 and - λ 3 (previously known as IL-29, IL-28A and IL-28B respectively).

Nomenclature	Interleukin-10 receptor	Interleukin-20 receptor	Interleukin-22 α 1/20 β heteromer	Interleukin-22 α 1/10 β heteromer	Interleukin-22 receptor α 2	Interferon- λ receptor 1
HGNC, UniProt	–	–	–	–	IL22RA2, Q969J5	–
Subunits	Interleukin 10 receptor, α subunit (ligand-binding subunit), Interleukin 10 receptor, β subunit (Other subunit)	Interleukin 20 receptor, β subunit (Other subunit), Interleukin 20 receptor, α subunit (Ligand-binding subunit)	Interleukin 22 receptor, α 1 subunit (ligand-binding subunit), Interleukin 20 receptor, β subunit (ligand-binding subunit)	Interleukin 22 receptor, α 1 subunit (ligand-binding subunit), Interleukin 10 receptor, β subunit (ligand-binding subunit)	–	Interferon- λ receptor subunit 1 (ligand-binding subunit), Interleukin 10 receptor, β subunit (Other subunit)
Endogenous agonists	IL-10 (IL10, P22301)	IL-19 (IL19, Q9UHD0), IL-20 (IL20, Q9NYY1), IL-24 (IL24, Q13007)	IL-20 (IL20, Q9NYY1), IL-24 (IL24, Q13007)	IL-22 (IL22, Q9GZX6)	–	IFN- λ 1 (IFNL1, Q8IU54), IFN- λ 2 (IFNL2, Q8IZJ0), IFN- λ 3 (IFNL3, Q8IZJ9)
Comments	–	–	–	–	Soluble decoy receptor that binds IL-22 (IL22, Q9GZX6) as a monomer.	–

Subunits

Immunoglobulin-like family of IL-1 receptors

Catalytic receptors → Cytokine receptor family → Immunoglobulin-like family of IL-1 receptors

Overview: The immunoglobulin-like family of IL-1 receptors are heterodimeric receptors made up of a cognate receptor subunit and an IL-1 receptor accessory protein, *IL1RAcP* (Q9NPH3, also known as C3orf13, IL-1RAcP, IL1R3). They are characterised by extracellular immunoglobulin-like domains and an intracellular Toll/Interleukin-1R (TIR) domain.

Nomenclature	Interleukin-1 receptor, type I	Interleukin-33 receptor	Interleukin-36 receptor	Interleukin-1 receptor, type II	Interleukin-18 receptor
Subunits	IL-1 receptor accessory protein (Other subunit), Interleukin 1 receptor, type I (Ligand-binding subunit)	IL-1 receptor accessory protein (Other subunit), Interleukin-1 receptor-like 1 (Ligand-binding subunit)	IL-1 receptor accessory protein (Other subunit), Interleukin-1 receptor-like 2 (Ligand-binding subunit)	IL-1 receptor accessory protein (Other subunit), Interleukin 1 receptor, type II (Ligand-binding subunit)	IL-18 receptor accessory protein (Other subunit), Interleukin-18 1 (Ligand-binding subunit)
Inhibitors	anakinra (pK _d 7.8) [39]	–	–	–	–
Endogenous agonists	IL-1α (IL1A, P01583), IL-1β (IL1B, P01584)	IL-33 (IL33, Q95760)	IL-36α (IL36A, Q9UHA7), IL-36β (IL36B, Q9NZH7), IL-36γ (IL36C, Q9NZH8)	–	IL-18 (IL18, Q14116), IL-37 (IL37, Q9NZH6)
Endogenous antagonists	IL-1 receptor antagonist (IL1RN, P18510)	–	IL-36 receptor antagonist (IL36RN, Q9UBH0)	–	–
Selective antagonists	AF12198 [1]	–	–	–	–
Comments	–	–	IL-36 receptor antagonist (IL36RN, Q9UBH0) is a highly selective antagonist of the response to IL-36γ (IL36C, Q9NZH8).	Decoy receptor that binds IL-1α (IL1A, P01583), IL-1β (IL1B, P01584) and IL-1 receptor antagonist (IL1RN, P18510).	–

IL-17 receptor family

Catalytic receptors → Cytokine receptor family → IL-17 receptor family

Overview: The IL-17 cytokine family consists of six ligands (IL-17A-F), which signal through five receptors (IL-17RA-E).

Nomenclature	Interleukin-17 receptor	Interleukin-25 receptor	Interleukin-17C receptor
Subunits	Interleukin 17 receptor A (Ligand-binding subunit), interleukin 17 receptor C (Other subunit)	Interleukin 17 receptor B (Ligand-binding subunit), Interleukin 17 receptor A (Other subunit)	Interleukin 17 receptor A (Other subunit), Interleukin 17 receptor E (Ligand-binding subunit)
Endogenous agonists	IL-17A (IL17A, Q16552), IL-17A/IL-17F (IL17A, IL17F, Q16552, Q96PDA), IL-17F (IL17F, Q96PDA)	IL-17B (IL17B, Q9UHF5), IL-25 (IL25, Q9H293)	IL-17C (IL17C, Q9P0M4)

Subunits

Nomenclature	Interleukin 17 receptor A	Interleukin 17 receptor B	Interleukin 17 receptor C	Interleukin-17 receptor D	Interleukin 17 receptor E
HGNC, UniProt	IL17RA, Q96F46	IL17RB, Q9NRM6	IL17RC, Q8NAC3	IL17RD, Q8NFM7	IL17RE, Q8NFR9
Antibodies	brodalumab (Binding) (pK _d 9.2) [206]	–	–	–	–
Comments	–	–	–	The endogenous agonist for this receptor is unknown.

GDNF receptor family

Catalytic receptors → GDNF receptor family

Overview: GDNF family receptors (provisional nomenclature) are extrinsic tyrosine kinase receptors. Ligand binding to the extracellular domain of the glycosylphosphatidylinositol-linked cell-surface receptors (tabulated below) activates a transmembrane tyrosine kinase enzyme, RET (see Receptor Tyrosine Kinases). The endogenous ligands are typically dimeric, linked through disulphide bridges: glial cell-derived neurotrophic factor GDNF (GDNF, P39905) (211 aa); neurturin (NRTN, Q99748) (197 aa); artemin (ARTN, Q514W7) (237 aa) and persephin (PSPN, O60542) (PSPN, 156 aa).

Nomenclature	GDNF family receptor $\alpha 1$	GDNF family receptor $\alpha 2$	GDNF family receptor $\alpha 3$	GDNF family receptor $\alpha 4$
HGNC, UniProt	GFR $\alpha 1$, P56159	GFR $\alpha 2$, O00451	GFR $\alpha 3$, O60609	GFR $\alpha 4$, Q9GZZ7
Common abbreviation	GFR $\alpha 1$	GFR $\alpha 2$	GFR $\alpha 3$	GFR $\alpha 4$
Potency order	GDNF (GDNF, P39905) > neurturin (NRTN, Q99748) > artemin (ARTN, Q514W7)	neurturin (NRTN, Q99748) > GDNF (GDNF, P39905)	artemin (ARTN, Q514W7)	persephin (PSPN, O60542)
Labelled ligands	[¹²⁵ I]GDNF (rat) (pK _d 10.2–11.5) [90, 180]	–	–	–

Comments: Inhibitors of other receptor tyrosine kinases, such as **semaxanib**, which inhibits VEGF receptor function, may also inhibit Ret function [132]. Mutations of RET and GDNF genes may be involved in Hirschsprung’s disease, which is characterized by the absence of intramural ganglion cells in the hindgut, often resulting in intestinal obstruction.

Integrins

Catalytic receptors → Integrins

Overview: Integrins are unusual signalling proteins that function to signal both from the extracellular environment into the cell, but also from the cytoplasm to the external of the cell. The intracellular signalling cascades associated with integrin activation focus on protein kinase activities, such as focal adhesion kinase and Src. Based on this association between extracellular signals and intracellular protein kinase activity, we have chosen to include integrins in the ‘Catalytic receptors’ section of the database until more stringent criteria from NC-IUPHAR allows precise definition of their classification.

Integrins are heterodimeric entities, composed of α and β subunits, each ITM proteins, which bind components of the extracellular matrix or counter-receptors expressed on other cells. One class of integrin contains an inserted domain (I) in its α subunit, and it present (in $\alpha 1$, $\alpha 2$, $\alpha 10$, $\alpha 11$, αD , αE , αL and αX), this I domain contains the ligand binding site. All β subunits possess a similar I-like domain, which has the capacity to bind ligand, often recognising the RGD motif. The presence of an α subunit I domain precludes ligand binding through the β subunit. Integrins provide a link between ligand and the actin cytoskeleton (through typi-

cally short intracellular domains). Integrins bind several divalent cations, including a Mg^{2+} ion in the I or I-like domain that is essential for ligand binding. Other cation binding sites may regulate integrin activity or stabilise the 3D structure. Integrins regulate the activity of particular protein kinases, including focal adhesion kinase and integrin-linked kinase. Cellular activation regulates integrin ligand affinity via inside-out signalling and ligand binding to integrins can regulate cellular activity via outside-in signalling.

Nomenclature	integrin $\alpha 1 \beta 1$	integrin $\alpha 2 \beta 1$	integrin $\alpha 1 \beta 3$	integrin $\alpha 4 \beta 1$
Subunits	integrin, beta 1 subunit (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12), integrin, alpha 1 subunit	integrin, beta 1 subunit (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12), integrin, alpha 2 subunit (CD49B, alpha 2 subunit of VLA-2 receptor)	integrin, beta 3 subunit (platelet glycoprotein IIla, antigen CD61), integrin, alpha IIb subunit (platelet glycoprotein IIb of IIb/IIIa complex, antigen CD41)	integrin, beta 1 subunit (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12), integrin, alpha 4 subunit (antigen CD49D, alpha 4 subunit of VLA-4 receptor)
Ligands	collagen, laminin	collagen, laminin, thrombospondin	fibronogen (<i>FGA FGB FGC</i> , P02671 P02675 P02679), fibronectin (<i>FN1</i> , P02751), von Willebrand factor (<i>VWF</i> , P04275), vitronectin (<i>VTN</i> , P04004), thrombospondin	fibronectin (<i>FN1</i> , P02751), vascular cell adhesion protein 1 (<i>VCAM1</i> , P19320), osteopontin (<i>SPPI</i> , P10451), thrombospondin

Comments: Integrin ligands

Collagen is the most abundant protein in metazoa, rich in glycine and proline residues, made up of cross-linked triple helical structures, generated primarily by fibroblasts. Extensive post-translational processing is conducted by prolyl and lysyl hydroxylases, as well as transglutaminases. Over 40 genes for collagen- α subunits have been identified in the human genome. The collagen-binding integrins $\alpha 1 \beta 1$, $\alpha 2 \beta 1$, $\alpha 10 \beta 1$ and $\alpha 11 \beta 1$ recognise a range of triple-helical peptide motifs including GFOGER (O = hydroxyproline), a synthetic peptide derived from the primary sequence of collagen I ([COL1A1](#) ([COL1A1](#), [P02452](#)))

and collagen II ([COL2A1](#) ([COL2A1](#), [P02458](#))).

Laminin is an extracellular glycoprotein composed of α , β and γ chains, for which five, four and three genes, respectively, are identified in the human genome. It binds to $\alpha 1 \beta 1$, $\alpha 2 \beta 1$, $\alpha 3 \beta 1$, $\alpha 7 \beta 1$ and $\alpha 6 \beta 4$ integrins10.

Fibrinogen ([FGA](#) [FGB](#) [FGG](#), [P02671](#) [P02675](#) [P02679](#)) is a glycosylated hexamer composed of two α ([FGA](#), [P02671](#)), two β ([FGB](#), [P02675](#)) and two γ ([FGG](#), [P02679](#)) subunits, linked by disulphide bridges. It is found in plasma and alpha granules of platelets. It forms cross-links between activated platelets mediating aggregation by binding $\alpha 1 \text{Ib} \beta 3$; proteolysis by thrombin

cleaves short peptides termed fibrinopeptides to generate fibrin, which polymerises as part of the blood coagulation cascade.

Fibronectin ([FNI](#), [P02751](#)) is a disulphide-linked homodimer found as two major forms; a soluble dimeric form found in the plasma and a tissue version that is polymeric, which is secreted into the extracellular matrix by fibroblasts. Splice variation of the gene product ([FNI](#), [P02751](#)) generates multiple isoforms.

Vitronectin ([VTN](#), [P04004](#)) is a serum glycoprotein and extracellular matrix protein which is found either as a monomer or, following proteolysis, a disulphide-linked dimer.

Osteopontin ([SPP1](#), [P10451](#)) forms an integral part of the

mineralized matrix in bone, where it undergoes extensive post-translation processing, including proteolysis and phosphorylation.

von Willebrand factor (VWF, P04275) is a glycoprotein synthesised in vascular endothelial cells as a disulphide-linked homodimer, but multimerises further in plasma and is deposited on vessel wall collagen as a high molecular weight multimer. It is responsible for capturing platelets under arterial shear flow (via GPIb) and in thrombus propagation (via integrin α IIb β 3).

Natriuretic peptide receptor family

Catalytic receptors → Natriuretic peptide receptor family

Overview: Natriuretic peptide receptors (NPRs, provisional nomenclature) are a family of homodimeric, catalytic receptors with a single TM domain and guanylyl cyclase (EC 4.6.1.2) activity on the intracellular domain of the protein sequence. Isoforms are activated by the peptide hormones atrial natriuretic peptide (ANP), POU160), brain natriuretic peptide (BNP, P16860) and C-type natriuretic peptide (NPPC, P23582). Another family member is GC-C, the receptor for guanylin (GUC42A, Q02747) and uroguanylin (GUC42B, Q16661). Family members have conserved ligand-binding, catalytic (guanylyl cyclase) and regulatory domains with the exception of NPR-C which has an extracellular binding domain homologous to that of other NPRs, but with a truncated intracellular domain which appears to couple, via the G α_o family of G proteins, to activation of phospholipase C, inwardly-rectifying potassium channels and inhibition of adenylyl cyclase activity [136].

Nomenclature	Guanylyl cyclase-A	Guanylyl cyclase-B	Guanylyl cyclase-C	natriuretic peptide receptor 3
HGNC, UniProt	NPRL, P16066	NPR2, P20594	GUCY2C, P25092	NPR3, P17342
Common abbreviation	GC-A	GC-B	GC-C	NPR-C
Potency order	atrial natriuretic peptide (ANP, POU1160) ≥ brain natriuretic peptide (BNP, P16860) ≫ C-type natriuretic peptide (NPPC, P23582) [172]	C-type natriuretic peptide (NPPC, P23582) ≫ atrial natriuretic peptide (ANP, POU1160) ≫ brain natriuretic peptide (BNP, P16860) [172]	uroguanylin (GUC42B, Q16661) > guanylin (GUC42A, Q02747)	atrial natriuretic peptide (ANP, POU1160) > C-type natriuretic peptide (NPPC, P23582) ≥ brain natriuretic peptide (BNP, P16860) [172]
Endogenous ligands	atrial natriuretic peptide (ANP, POU1160) [210] brain natriuretic peptide (BNP, P16860) [210]	C-type natriuretic peptide (NPPC, P23582) [172]	guanylin (GUC42A, Q02747), uroguanylin (GUC42B, Q16661)	osteocrin (OSTN, P61366) [148]
Selective agonists	Dendroaspis natriuretic peptide [211], sANP [210], cenderitide [212]	cenderitide [121], vosoritide [112]	linacloctide [18, 65], E. coli heat-stable enterotoxin (STa) [18], plicanotide [190]	CANF4-23 [132]

(continued)			
Nomenclature	Guanylyl cyclase-A	Guanylyl cyclase-B	Guanylyl cyclase-C
Selective antagonists	A-71915 pK _i 9.2–9.5 [213], [Asu7,23]β-ANP-(7-28) pK _i 7.5 [14], anantin [215, 216], H5142-1 [217]	peptide P19 (pK _d 7.8) [37], H5142-1 [151], [Ser11](N-CNP;C-ANP)pBBNP2-15 [37], compound C10 [10]	–
Labelled ligands	[¹²⁵ I]ANP (human) (Agonist)	[¹²⁵ I]CNP (human)	[¹²⁵ I]Sta (Agonist) [63] [¹²⁵ I]ANP (human)

Comments: The polysaccharide obtained from fermentation of *Aureobasidium* species, **H5142-1**, acts as an antagonist at both GC-A and GC-B receptors [133].

GUICY2D (RetGC1, GC-E, **Q02846**) and **GUICY2F** (RetGC2, GC-F, **P51841**) are predominantly retinal guanylyl cyclase activities, which are inhibited by calcium ions acting through the guany-

lyl cyclase activating peptides GCAP1 (**GUCA1A**, **43080**), GCAP2 (**GUCA1B**, **Q9UMX6**) and GCAP3 (**GUCA1C**, **O95843**) [76]. **GC-D** and **GC-G** are pseudogenes in man.

Pattern recognition receptors

Catalytic receptors → Pattern recognition receptors

Overview: Pattern Recognition Receptors (PRRs), [173] (**nomenclature as agreed by NC-IUPHAR sub-committee on Pattern Recognition Receptors**, [16]) participate in the innate immune response to microbial agents, the stimulation of which leads to activation of intracellular enzymes and regulation of gene transcription. PRRs express multiple leucine-rich regions to bind a range of microbially-derived ligands, termed PAMPs or pathogen-associated molecular patterns, which includes peptides, carbohydrates, peptidoglycans, lipoproteins, lipopolysaccharides, and nucleic acids. PRRs include both cell-surface and intracellular proteins. PRRs may be divided into signalling-associated members, identified here, and endocytic members, the function of which appears to be to recognise particular microbial motifs for subsequent cell attachment, internalisation and destruction. Some are involved in inflammasome formation, and modulation IL-1β cleavage and secretion, and others in the initiation of the type I interferon response.

PRRs included in the Guide To PHARMACOLOGY are:

Catalytic PRRs (see links below this overview)

Toll-like receptors (TLRs)

Nucleotide-binding oligomerization domain-like receptors (NLRs, also known as NOD-like receptors)

RIG-I-like receptors (RLRs)

Non-catalytic pattern recognition receptors

Absent in melanoma (AIM)-like receptors (ALRs)

C-type lectin-like receptors (CLRs), and

Other pattern recognition receptors.

Toll-like receptor family
Catalytic receptors → Pattern recognition receptors → Toll-like receptor family

Overview: Members of the toll-like family of receptors (nomenclature recommended by the NC-IUPHAR subcommittee on pattern recognition receptors, [16]) share significant homology with the interleukin-1 receptor family and appear to require dimerization either as homo- or heterodimers for functional activity. Heterodimerization appears to influence the potency of ligand binding substantially (e.g. TLR1/2 and TLR2/6, [174, 175]). TLR1, TLR2, TLR4, TLR5, TLR6 and TLR11 are cell-surface proteins, while other members are associated with intracellular organelles, signalling through the MyD88-dependent pathways (with the exception of TLR3). As well as responding to exogenous infectious agents, it has been suggested that selected members of the family may be activated by endogenous ligands, such as *hsp60 (HSPD1, P10809)* [161].

Nomenclature	TLR1	TLR2	TLR3	TLR4	TLR5
HGNC, UniProt	<i>TLR1, Q15399</i>	<i>TLR2, O60603</i>	<i>TLR3, O15455</i>	<i>TLR4, O00206</i>	<i>TLR5, O60602</i>
Agonists	–	<i>compound 13</i> [91], <i>peptidoglycan</i> [163, 205]	<i>poly(I:C)</i> [5]	<i>LPS</i> [150], <i>pacitaxel</i> [85] – Mouse <i>resatorvid</i> [78]	<i>flagellin</i> [67]
Selective antagonists	–	–	–	–	–
Comments	Functions as a heterodimer with TLR2 in detection of triacylated lipoproteins. Activated by the synthetic analogue <i>Pam3CSK4</i> .	Functions as a heterodimer with either TLR1 or TLR6 in the detection of triacylated and diacylated lipopeptides respectively. TLR1/2 and 2/6 heterodimers can be activated by the synthetic lipopeptides <i>Pam3CSK4</i> and <i>Pam2CSK4</i> respectively. There is some debate in the field as to whether or not peptidoglycan is a direct agonist of TLR2, or whether the early studies reporting this contained contaminating lipoproteins.	Involved in endosomal detection of dsRNA; pro-inflammatory.	<i>eritoran</i> (E5564) is a lipid A analogue, which has been described as a TLR4 antagonist [79]. TLR4 signals in conjunction with the co-factor <i>MD-2</i> (LV96).	Involved in the detection of bacterial flagellin; pro-inflammatory.

Nomenclature	TLR6	TLR7	TLR8	TLR9	TLR10	TLR11
HGNC, UniProt	<i>TLR6, Q9Y2C9</i>	<i>TLR7, Q9NWK1</i>	<i>TLR8, Q9NR97</i>	<i>TLR9, Q9NR96</i>	<i>TLR10, Q9BXR5</i>	–
Agonists	–	<i>imiquinod</i> [70], <i>loxoribine</i> [68], <i>resiquimod</i> [70, 83]	<i>resiquimod</i> [70, 83]	–	–	–
Antagonists	–	<i>hydroxychloroquine</i> (pIC ₅₀ 5.6) [96]	–	<i>hydroxychloroquine</i> (pIC ₅₀ 7.1) [96]	–	–

(continued)				
Nomenclature	TLR6	TLR7	TLR8	TLR9
Comments	Functions as a heterodimer with TLR2. Involved in the pro-inflammatory response to diacylated bacterial lipopeptides.	Activated by imidazoquinoline derivatives and RNA oligoribonucleotides. Involved in endosomal detection of ssRNA; pro-inflammatory.	Activated by imidazoquinoline derivatives and RNA oligoribonucleotides. Endosomal detection of ssRNA; pro-inflammatory.	Toll-like receptor 9 interacts with unmethylated CpG dinucleotides from bacterial DNA [71]. Activated by CpG rich DNA sequences; pro-inflammatory.
				TLR10
				TLR11
				TLR10 is the only pattern-recognition receptor without known ligand specificity and biological function. Evidence suggests it plays a modulatory role with predominantly inhibitory (anti-inflammatory) actions [145]. Murine TLR10 has a retroviral insertion that makes it non-functional.

NOD-like receptor family

Catalytic receptors → Pattern recognition receptors → NOD-like receptor family

Overview: The nucleotide-binding oligomerization domain, leucine-rich repeat (NLR) family of receptors (nomenclature recommended by the NC-IUPHAR subcommittee on pattern recognition receptors [16]) share a common domain organisation. This consists of an N-terminal effector domain, a central nucleotide-binding and oligomerization domain (NOD; also referred to as a NACHT domain), and C-terminal leucine-rich repeats (LR) which have regulatory and ligand recognition functions. The type of effector domain has resulted in the division of NLR family members into two major sub-families, NLR and NLRP, along with three smaller sub-families NLRA, NLRB and NLRX [177]. NLR members express an N-terminal caspase recruitment domain (CARD) and NLRP members an N-terminal Pyrin domain (PYD). Upon activation the NLR family members NOD1 (NLRP1) and NOD2 (NLRP2) recruit a serine/threonine kinase *RIPEK2* (receptor interacting serine/threonine kinase 2, **O43353**, also known as CARD3, CARDIAC, RICK, RLP2) leading to signalling through NfκB and MAP kinase. Activation of NLRP4 (previously known as IPAF) and members of the NLRP3 family, including NLRP1 and NLRP3, leads to formation of a large multiprotein complex known as the inflammasome. In addition to NLR proteins other key members of the inflammasome include the adaptor protein ASC (apoptosis-associated speck-like protein containing a CARD, also known as *PYCARD*), CARD5, TMS1, **Q9UIZ3** and inflammatory caspases. The inflammasome activates the pro-inflammatory cytokines **IL-1β** (*TLR*, **P01584**) and **IL-18** (*TLR*, **Q14116**) [16, 32].

Nomenclature	nucleotide binding oligomerization domain containing 1	nucleotide binding oligomerization domain containing 2	NLR3	NLR4	NLR5	NLRX1	CIITA
HCNC, UniProt	NOD1, Q9Y239	NOD2, Q9HC29	NLR3, Q7RTR2	NLR4, Q9NPP4	NLR5, Q86W13	NLRX1, Q86UT6	CIITA, P33076
Common abbreviation	NOD1	NOD2	–	–	–	–	–
Agonists	meso-DAP	muramyl dipeptide	–	–	–	–	–
Comments	–	NOD2 has also been reported to be activated by ssRNA [158] although this has not been widely reproduced.	–	NLR4 forms an inflammasome in conjunction with the NALP proteins and responds to bacterial flagellin and type III secretion system rod proteins.	–	–	–

Nomenclature	NLRP1	NLRP2	NLRP3	NLRP4	NLRP5	NLRP6	NLRP7
HCNC, UniProt	NLRP1, Q9C000	NLRP2, Q9NX02	NLRP3, Q96P20	NLRP4, Q96MN2	NLRP5, P59047	NLRP6, P59044	NLRP7, Q8WX94
Inhibitors	–	–	MCC950 (pIC ₅₀ > 8) [25]	–	–	–	–
Agonists	muramyl dipeptide	–	–	–	–	–	–
Comments	NLRP1 has 3 murine orthologues which lack the N-terminal Pyrin domain. Murine NLRP1b (ENSNUMSC00000070390) is the best characterised, responding to Anthrax Lethal Toxin.	Along with NLRP7, NLRP2 is the product of a primate-specific gene duplication.	Multiple virus particles have been shown to act as agonists, including Sendai and influenza. NLRP3 has been shown to be activated following disruption of cellular haemostasis by a wide-variety of exogenous and endogenous molecules. The identity of the precise agonist that interacts with NLRP3 remains enigmatic.	Expanded in the mouse resulting in 7 orthologues.	–	–	Absent in mouse. Along with NLRP2 the product of a primate-specific gene duplication.

Nomenclature	NLRP8	NLRP9	NLRP10	NLRP11	NLRP12	NLRP13	NLRP14
HGNC, UniProt	NLRP8, Q86W28	NLRP9, Q7RTRO	NLRP10, Q86W26	NLRP11, P59045	NLRP12, P59046	NLRP13, Q86W25	NLRP14, Q86W24
Comments	Absent in mouse	This receptor has three murine orthologues.	–	Absent in mouse	–	Absent in mouse	–

Comments: NLRP3 has also been reported to respond to host-derived products, known as danger-associated molecular patterns, or DAMPs, including uric acid [141], ATP, L-glucose, hyaluronan and amyloid β (A β P, P05067) [161].

Loss-of-function mutations of NLRP3 are associated with cold autoinflammatory and Muckle-Wells syndromes. This family also includes NLR family, apoptosis inhibitory protein (NAIP, Q13075) which can be found in the 'Inhibitors of apoptosis (IAP) protein family' in the [Other protein targets](#) section of the Guide.

Receptor tyrosine kinases (RTKs)

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs)

Overview: Receptor tyrosine kinases (RTKs), a family of cell-surface receptors, which transduce signals to polypeptide and protein hormones, cytokines and growth factors are key regulators of critical cellular processes, such as proliferation and differentiation, cell survival and metabolism, cell migration and cell cycle control [11, 57, 184]. In the human genome, 58 RTKs have been identified, which fall into 20 families [100].

All RTKs display an extracellular ligand binding domain, a single transmembrane helix, a cytoplasmic region containing the protein tyrosine kinase activity (occasionally split into two do-

mains by an insertion, termed the kinase insertion), with juxta-membrane and C-terminal regulatory regions. Agonist binding to the extracellular domain evokes dimerization, and sometimes oligomerization, of RTKs (a small subset of RTKs forms multimers even in the absence of activating ligand). This leads to autophosphorylation in the tyrosine kinase domain in a trans orientation, serving as a site of assembly of protein complexes and stimulation of multiple signal transduction pathways, including phospholipase C- γ , mitogen-activated protein kinases and phosphatidylinositol 3-kinase [184].

RTKs are of widespread interest not only through physiological functions, but also as drug targets in many types of cancer and other disease states. Many diseases result from genetic changes or abnormalities that either alter the activity, abundance, cellular distribution and/or regulation of RTKs. Therefore, drugs that modify the dysregulated functions of these RTKs have been developed which fall into two categories. One group is often described as 'biologicals', which block the activation of RTKs directly or by chelating the cognate ligands, while the second are small molecules designed to inhibit the tyrosine kinase activity directly.

Type I RTKs: ErbB (epidermal growth factor) receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type I RTKs: ErbB (epidermal growth factor) receptor family

Overview: ErbB family receptors are Class I receptor tyrosine kinases [57]. ERBB2 (also known as HER-2 or NEU) appears to act as an essential partner for the other members of the family without itself being activated by a cognate ligand [58]. Ligands of the ErbB family of receptors are peptides, many of which are generated by proteolytic cleavage of cell-surface proteins. HER/ErbB is the viral counterpart to the receptor tyrosine kinase EGFR. All family members heterodimerize with each other to activate downstream signalling pathways and are aberrantly expressed in many cancers, particularly forms of breast cancer and lung cancer. Mutations in the EGFR are responsible for acquired resistance to tyrosine kinase inhibitor chemotherapeutics.

Nomenclature	epidermal growth factor receptor	erb-b2 receptor tyrosine kinase 2	erb-b2 receptor tyrosine kinase 3	erb-b2 receptor tyrosine kinase 4
HQNC, UniProt	EGFR, P00533	ERBB2, P04626	ERBB3, P21860	ERBB4, Q15303
EC number	2.7.10.1	2.7.10.1	2.7.10.1	2.7.10.1
Common abbreviation	EGFR	HER2	HER3	HER4
Endogenous ligands	EGF (EGF, P01133), HB-EGF (HBEGF, Q99075), TGFα (TGFA, P01135), amphiregulin (AREG, P15514), betacellulin (BTC, P35070), epigen (EPGN, Q6UW88), epiregulin (EREG, O14944)	–	neuregulin-1 (NRG1, Q02297), neuregulin-2 (NRG2, O14511)	HB-EGF (HBEGF, Q99075), betacellulin (BTC, P35070), epiregulin (EREG, O14944), neuregulin-1 (NRG1, Q02297), neuregulin-2 (NRG2, O14511), neuregulin-3 (NRG3, P56975), neuregulin-4 (NRG4, Q8WWC1)
Inhibitors	canertinib (pK _d 9.7) [33], afatinib (pK _d 9.6) [33], tesevatinib (pIC ₅₀ 9.5) [63], afatinib (pIC ₅₀ 8–9.3) [36, 119], erlotinib (pK _d 9.2) [33], gefitinib (pK _d 9) [33],	poziotinib (pIC ₅₀ 8.3) [139], neratinib (pK _d 8.2) [33], lapatinib (pK _d 8.1) [33], CP-724714 (pIC ₅₀ 7.9) [60], tesevatinib (pIC ₅₀ 7.8) [63], BMS-690514 (pIC ₅₀ 7.7) [117]	–	poziotinib (pIC ₅₀ 7.6) [139]
Antibodies	necitumumab (Binding) (pK _d 9.5) [128], cetuximab (Binding) (pK _d 9.4) [66]	pertuzumab (Inhibition) (pIC ₅₀ > 8) [100], trastuzumab (Inhibition)	–	–

Comments: [125]EGF (human) has been used to label the ErbB1 EGF receptor. The extracellular domain of ErbB2 can be targeted by the antibodies trastuzumab and pertuzumab to inhibit ErbB family action. The intracellular ATP-binding site of the tyrosine kinase domain can be inhibited by GW583340 (7.9–8.0, [50]), gefitinib, erlotinib and tyrphostins AG879 and AG1478.

Kobayashi Y *et al.* (2016) Not all EGFR mutations in lung cancer are created equal: Perspectives for individualized treatment strategy. *Cancer Sci.* [PMID:27323238]

Type II RTKs: Insulin receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type II RTKs: Insulin receptor family

Overview: The circulating peptide hormones **insulin** (*INS*, P01308) and the related insulin-like growth factors (IGF) activate Class II receptor tyrosine kinases [57], to evoke cellular responses, mediated through multiple intracellular adaptor proteins. Exceptionally amongst the catalytic receptors, the functional receptor in the insulin receptor family is derived from a single gene product, cleaved post-translationally into two peptides, which then cross-link via disulphide bridges to form a heterotetramer. Intriguingly, the endogenous peptide ligands are formed in a parallel fashion with post-translational processing producing a heterodimer linked by disulphide bridges. Signalling through the receptors is mediated through a rapid autophosphorylation event at intracellular tyrosine residues, followed by recruitment of multiple adaptor proteins, notably *IRS1* (P35568), *IRS2* (Q9Y4H2), *SHC1* (P29353), *GRB2* (P62993) and *SOS1* (Q07889). Serum levels of free IGFs are kept low by the action of IGF binding proteins (IGFBP1-5, P08833, P18065, P17936, P22692, P24593), which sequester the IGFs; overexpression of IGFBPs may induce apoptosis, while IGFBP levels are also altered in some cancers.

Nomenclature	Insulin receptor	Insulin-like growth factor I receptor	Insulin receptor-related receptor	
HGNC, UniProt	<i>INSR</i> , P06213	<i>IGF1R</i> , P08069	<i>INSRR</i> , P14616	
EC number	2.7.10.1	2.7.10.1	2.7.10.1	
Common abbreviation	InSR	IGF1R	IRR	
Inhibitors	–	BMS-754807 (pIC ₅₀ 8.7) [198], GSK-1838705A (pIC ₅₀ 8.7) [159], GSK-1838705A (pK _d 8.1) [33], PQ401 (pIC ₅₀ >6) [47], AG 1024 (pIC ₅₀ 4.7) [153] NVP-AEW541 (pIC ₅₀ 9.4) [49]	–	–
Selective inhibitors	–	insulin-like growth factor 1 (<i>IGF1</i> , P05019), insulin-like growth factor 2 (<i>IGF2</i> , P01344)	–	–
Endogenous agonists	insulin (<i>INS</i> , P01308)			

Comments: There is evidence for low potency binding and activation of insulin receptors by IGF1. IGF2 also binds and activates the cation-independent mannose 6-phosphate receptor (also known as the insulin-like growth factor 2 receptor; *IGF2R*; P11717), which lacks classical signalling capacity and appears to subserve a trafficking role [115]. *INSRR*, which has a much more discrete localization, being predominant in the kidney [93], currently lacks a cognate ligand or evidence for functional impact. Antibodies targeting IGF1, IGF2 and the extracellular portion of the IGF1 receptor are in clinical trials. *PQ401* inhibits the insulin-like growth factor receptor [5], while BMS-536924 inhibits both the insulin receptor and the insulin-like growth factor receptor [197].

Type III RTKs: PDGFR, CSFR, Kit, FLT3 receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type III RTKs: PDGFR, CSFR, Kit, FLT3 receptor family

Overview: Type III RTKs include PDGFR, CSF-1R (Ems), Kit and FLT3, which function as homo- or heterodimers. Endogenous ligands of PDGF receptors are homo- or heterodimeric: PDGFA, PDGFB, VEGF β and PDGFD (*PDGFD*, *Q9GZF0*) combine as homo- or heterodimers to activate homo- or heterodimeric PDGF receptors. SCF is a dimeric ligand for KIT. Ligands for CSF1R are either monomeric or dimeric glycoproteins, while the endogenous agonist for FLT3 is a homodimer.

Nomenclature	platelet derived growth factor receptor alpha	platelet derived growth factor receptor beta	KIT proto-oncogene receptor tyrosine kinase
HGNC, UniProt	<i>PDGFRA</i> , P16234	<i>PDGFRB</i> , P09619	<i>KIT</i> , P10721
EC number	2.7.10.1	2.7.10.1	2.7.10.1
Common abbreviation	PDGFR α	PDGFR β	Kit
Endogenous ligands	PDGF	PDGF	–
Inhibitors	PP121 (pIC ₅₀ 8.7) [4], crenolanib (pK _d 8.7) [69], ENMD-2076 (pIC ₅₀ 7.2) [149]	crenolanib (pK _d 8.5) [69], SU-14813 (pIC ₅₀ 8.4) [147], famitinib (pIC ₅₀ 8.4) [21], sunitinib (pIC ₅₀ 8.2) [89], sunitinib (pK _i 8.1) [127]	sunitinib (pK _d 9.4) [33], famitinib (pIC ₅₀ 8.7) [21], mastitinib (pK _d 8.1) [33], SU-14813 (pIC ₅₀ 7.8) [147], AKN-028 (pIC ₅₀ 7.5) [42], sorafenib (pIC ₅₀ 7.2) [196]
Selective inhibitors	CP-673451 (pIC ₅₀ 8) [156]	CP-673451 (pIC ₅₀ 9) [156]	–
Endogenous agonists	–	–	stem cell factor (<i>KITLG</i> , P21583) [183]

Nomenclature	colony stimulating factor 1 receptor	fms related tyrosine kinase 3
HGNC, UniProt	<i>CSF1R</i> , P07333	<i>FLT3</i> , P36888
EC number	2.7.10.1	2.7.10.1
Common abbreviation	CSFR	FLT3
Endogenous ligands	G-CSF (<i>CSF3</i> , P09919), GM-CSF (<i>CSF2</i> , P04141), M-CSF (<i>CSF1</i> , P09603)	Fms-related tyrosine kinase 3 ligand (<i>FLT3LG</i> , P49771)
Inhibitors	[N]-28312141 (pIC ₅₀ 9.2) [116], Ki-202227 (pK _d 9.1) [33], Ki-202227 (pIC ₅₀ 8.7) [143], GW-2580 (pK _d 8.7) [33], [N]-28312141 (pK _d 8.5) [33]	AC710 (pK _d 9.3) [108], linifanib (pK _d 9.2) [33], dovitinib (pK _d 9.2) [33], crenolanib (pK _d 9.1) [69], AST-487 (pK _d 9.1) [33], ENMD-2076 (pIC ₅₀ 8.5) [149], tandutinib (pK _d 8.5) [33]
Selective inhibitors	GW-2580 (pIC ₅₀ 7.2) [27]	G749 (pIC ₅₀ 9.4) [97]
Comments	Upregulation of CSF1R expression is associated with microglial activation and immune pathology in Alzheimer's disease (AD) [67, 61]. Pharmacological inhibition of CSF1R with GW-2580 reduces microglial proliferation and prevents disease progression in a mouse model of AD, but this does not correlate with amyloid- β plaque numbers [144].	5'-fluorouridintrubinoxime has been described as a selective FLT3 inhibitor [22].

Comments: Various small molecular inhibitors of type III RTKs have been described, including [imatinib](#) and [nilotinib](#) (targeting PDGFR, KIT and CSF1R), [midostaurin](#) and [AC220](#) ([quizartinib](#), [FLT3](#)), as well as pan-type III RTK inhibitors such as [sunitinib](#) and [sorafenib](#) [[148](#)]; 5'-fluorouridintruboxime has been described as a selective [FLT3](#) inhibitor [[1](#)].

Type IV RTKs: VEGF (vascular endothelial growth factor) receptor family

Catalytic receptors → **Receptor kinases** → **TK: Tyrosine kinase** → **Receptor tyrosine kinases (RTKs)** → **Type IV RTKs: VEGF (vascular endothelial growth factor) receptor family**

Overview: **VEGF** receptors are homo- and heterodimeric proteins, which are characterized by seven Ig-like loops in their extracellular domains and a split kinase domain in the cytoplasmic region. They are key regulators of angiogenesis and lymphangiogenesis; as such, they have been the focus of drug discovery for conditions such as metastatic cancer. Splice variants of VEGFR1 and VEGFR2 generate truncated proteins limited to the extracellular domains, capable of homodimerisation and binding VEGF ligands as a soluble, non-signalling entity. Ligands at VEGF receptors are typically homodimeric. [VEGFA](#) ([VEGFA](#), [P15692](#)) is able to activate VEGFR1 homodimers, VEGFR1/2 heterodimers and VEGFR2/3 heterodimers. [VEGFB](#) ([VEGFB](#), [P49765](#)) and [placental growth factor \(PGF](#), [P49763](#)) activate VEGFR1 homodimers, while [VEGFC](#) ([VEGFC](#), [P49767](#)) and [VEGFD](#) ([VEGFD](#), [O43915](#)) activate VEGFR2/3 heterodimers and VEGFR3 homodimers, and, following proteolysis, VEGFR2 homodimers.

Antibodies	–	ramucirumab (Antagonist) (pIC₅₀ 9) [113]	–

Comments: The VEGFR, as well as VEGF ligands, have been targeted by antibodies and tyrosine kinase inhibitors. [DMH4](#) [[45](#)], [K18751](#) [[92](#)] and [ZM323881](#), a novel inhibitor of vascular endothelial growth factor-receptor-2 tyrosine kinase activity [[193](#)] are described as VEGFR2-selective tyrosine kinase inhibitors. [Bevacizumab](#) is a monoclonal antibody directed against VEGF-A, used clinically for the treatment of certain metastatic cancers; an antibody fragment has been used for wet age-related macular degeneration.

Type V RTKs: FGF (fibroblast growth factor) receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type V RTKs: FGF (fibroblast growth factor) receptor family

Overview: Fibroblast growth factor (FGF) family receptors act as homo- and heterodimers, and are characterized by Ig-like loops in the extracellular domain, in which disulphide bridges may form across protein partners to allow the formation of covalent dimers which may be constitutively active. FGF receptors have been implicated in achondroplasia, angiogenesis and numerous congenital disorders. At least 22 members of the FGF gene family have been identified in the human genome [8]. Within this group, subfamilies of FGF may be divided into canonical, intracellular and hormone-like FGFs. FGFR1-FGFR10 have been identified to act through FGF receptors, while FGF11-14 appear to signal through intracellular targets. Other family members are less well characterized [192].

Nomenclature	fibroblast growth factor receptor 1	fibroblast growth factor receptor 2	fibroblast growth factor receptor 3	fibroblast growth factor receptor 4
HGNC, UniProt	<i>FGFR1</i> , P11362	<i>FGFR2</i> , P21802	<i>FGFR3</i> , P22607	<i>FGFR4</i> , P22455
EC number	2.7.10.1	2.7.10.1	2.7.10.1	2.7.10.1
Common abbreviation	FGFR1	FGFR2	FGFR3	FGFR4
Endogenous ligands	FGF-1 (<i>FGF1</i> , P05230), FGF-2 (<i>FGF2</i> , P09038), FGF-4 (<i>FGF4</i> , P08620) > FGF-5 (<i>FGF5</i> , P12034), FGF-6 (<i>FGF6</i> , P10767) [146]	FGF-1 (<i>FGF1</i> , P05230) > FGF-4 (<i>FGF4</i> , P08620), FGF-7 (<i>FGF7</i> , P21781), FGF-9 (<i>FGF9</i> , P31371) > FGF-2 (<i>FGF2</i> , P09038), FGF-6 (<i>FGF6</i> , P10767) [146]	FGF-1 (<i>FGF1</i> , P05230), FGF-2 (<i>FGF2</i> , P09038), FGF-9 (<i>FGF9</i> , P31371) > FGF-4 (<i>FGF4</i> , P08620), FGF-8 (<i>FGF8</i> , P55075) [146]	FGF-1 (<i>FGF1</i> , P05230), FGF-2 (<i>FGF2</i> , P09038), FGF-4 (<i>FGF4</i> , P08620), FGF-9 (<i>FGF9</i> , P31371) > FGF-6 (<i>FGF6</i> , P10767), FGF-8 (<i>FGF8</i> , P55075) [146]
Sub/family-selective inhibitors	LY2874455 (pIC ₅₀ 8.6) [205]	LY2874455 (pIC ₅₀ 8.6) [205]	LY2874455 (pIC ₅₀ 8.2) [205]	LY2874455 (pIC ₅₀ 8.2) [205]
Selective inhibitors	–	–	–	BLU9931 (pIC ₅₀ 8.5) [75]
Agonists	–	palifermin	–	–

Comments: Splice variation of the receptors can influence agonist responses. *FGFR1* (Q8N441) is a truncated kinase-null analogue. Various antibodies and tyrosine kinase inhibitors have been developed against FGF receptors [105, 209]. PD161570 is an FGFR tyrosine kinase inhibitor [8], while PD173074 has been described to inhibit FGFR1 and FGFR3 [168].

Type VI RTKs: PTK7/CCK4

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type VI RTKs: PTK7/CCK4

Overview: The PTK7 receptor is associated with polarization of epithelial cells and the development of neural structures. Sequence analysis suggests that the gene product is catalytically inactive as a protein kinase, although there is evidence for a role in Wnt signalling [152].

Nomenclature	protein tyrosine kinase 7 (inactive)		
HGNC, UniProt	PTK7, Q13308		
EC number	2.7.10.1		
Common abbreviation	CCK4		

Comments: Thus far, no selective PTK7 inhibitors have been described.

Type VII RTKs: Neurotrophin receptor/Trk family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type VII RTKs: Neurotrophin receptor/Trk family

Overview: The neurotrophin receptor family of RTKs include trkA, trkB and trkC (tropomyosin-related kinase) receptors, which respond to NGF, BDNF and neurotrophin-3, respectively. They are associated primarily with proliferative and migration effects in neural systems. Various isoforms of neurotrophin receptors exist, including truncated forms of trkB and trkC, which lack catalytic domains. p75 (TNFRSF16, also known as nerve growth factor receptor), which has homologies with **tumour necrosis factor receptors**, lacks a tyrosine kinase domain, but can signal via ceramide release and nuclear factor κ B (NF- κ B) activation. Both trkA and trkB contain two leucine-rich regions and can exist in monomeric or dimeric forms.

Nomenclature	neurotrophic receptor tyrosine kinase 1	neurotrophic receptor tyrosine kinase 2	neurotrophic receptor tyrosine kinase 3
HGNC, UniProt	<i>NTRK1</i> , P04629	<i>NTRK2</i> , Q16620	<i>NTRK3</i> , Q16288
EC number	2.7.10.1	2.7.10.1	2.7.10.1
Common abbreviation	trkA	trkB	trkC
Endogenous ligands	NGF (<i>NGF</i> , P01138) > neurotrophin-3 (<i>NTF3</i> , P20783)	BDNF (<i>BDNF</i> , P23560), neurotrophin-4 (<i>NTF4</i> , P34130) > neurotrophin-3 (<i>NTF3</i> , P20783)	neurotrophin-3 (<i>NTF3</i> , P20783)

(continued)			
Nomenclature	neurotrophic receptor tyrosine kinase 1	neurotrophic receptor tyrosine kinase 2	neurotrophic receptor tyrosine kinase 3
Inhibitors	compound 2c (pIC ₅₀ 8.9) [189], milciclib (pIC ₅₀ 7.3) [14]	–	–
Sub/family-selective inhibitors	AZD1332 (pIC ₅₀ > 8.3) [9], GNF-5837 (pIC ₅₀ 8) [2]	AZD1332 (pIC ₅₀ > 8.3) [9], GNF-5837 (pIC ₅₀ 8.1) [2]	AZD1332 (pIC ₅₀ > 8.3) [9], GNF-5837 (pIC ₅₀ 8.1) [2]

Comments: [¹²⁵I]NGF (human) and [¹²⁵I]BDNF (human) have been used to label the trkA and trkB receptor, respectively. p75 influences the binding of NGF (NGF, P01138) and neurotrophin-3 (NTF3, P20783) to trkA. The ligand selectivity of p75 appears to be dependent on the cell type; for example, in sympathetic neurons, it binds neurotrophin-3 (NTF3, P20783) with comparable affinity to trkC [35]. Small molecule agonists of trkB have been described, including LM22A4 [124], while ANA12 has been described as a non-competitive antagonist of BDNF binding to trkB [20]. GNF5837 is a family-selective tyrosine kinase inhibitor [2], while the tyrosine kinase activity of the trkA receptor can be inhibited by GW441756 (pIC₅₀ = 8.7, [198]) and tyrophostin AG879 [162].

Type VIII RTKs: ROR family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type VIII RTKs: ROR family

Overview: Members of the ROR family appear to be activated by ligands complexing with other cell-surface proteins. Thus, ROR1 and ROR2 appear to be activated by Wnt-5a (WNT5A, P41221) binding to a Frizzled receptor thereby forming a cell-surface multiprotein complex [59].

Nomenclature	receptor tyrosine kinase like orphan receptor 1	receptor tyrosine kinase like orphan receptor 2
HGNC, UniProt	ROR1, Q01973	ROR2, Q01974
EC number	2.7.10.1	2.7.10.1
Common abbreviation	ROR1	ROR2

Type IX RTKs: MusK

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type IX RTKs: MusK

Overview: The muscle-specific kinase MusK is associated with the formation and organisation of the neuromuscular junction from the skeletal muscle side. *Agtrin (AGRN, O00468)* forms a complex with low-density lipoprotein receptor-related protein 4 (*LRP4, O75096*) to activate MusK [87].

Nomenclature	muscle associated receptor tyrosine kinase	
HGNC, UniProt	<i>MUSK</i> , O15146	
EC number	2.7.10.1	
Common abbreviation	MusK	

Comments: Thus far, no selective MusK inhibitors have been described.

Type X RTKs: HGF (hepatocyte growth factor) receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type X RTKs: HGF (hepatocyte growth factor) receptor family

Overview: HGF receptors regulate maturation of the liver in the embryo, as well as having roles in the adult, for example, in the innate immune system. HGF is synthesized as a single gene product, which is post-translationally processed to yield a heterodimer linked by a disulphide bridge. The maturation of HGF is enhanced by a serine protease, HGF activating complex, and inhibited by *HGF-inhibitor 1 (SPINT1, O43278)*, a serine protease inhibitor. MST1, the ligand of RON, is two disulphide-linked peptide chains generated by proteolysis of a single gene product.

Nomenclature	MET proto-oncogene, receptor tyrosine kinase	
HGNC, UniProt	<i>MET</i> , P08581	macrophage stimulating 1 receptor <i>MST1R, Q04912</i>
EC number	2.7.10.1	2.7.10.1
Common abbreviation	MET	Ron
Endogenous ligands	hepatocyte growth factor (<i>HGF, P14210</i>)	macrophage stimulating protein 1 (<i>MST1, P09603</i>)
Inhibitors	capmatinib (pIC ₅₀ 9.9) [111], <i>SGX-523</i> (pK _d 9.7) [33], <i>PHA-665752</i> (pK _d 9.6) [33], <i>foretinib</i> (pIC ₅₀ 9.3–9.4) [104, 137], <i>cabozantinib</i> (pIC ₅₀ 8.9) [200]	<i>BMS-777607</i> (pIC ₅₀ 8.7) [162]
Selective inhibitors	<i>SGX-523</i> (pIC ₅₀ 8.4) [17]	–

Comments: PH04217903 is a selective Met tyrosine kinase inhibitor [29]. *SU11274* is an inhibitor of the HGF receptor [185], with the possibility of further targets [5].

Type XI RTKs: TAM (TYRO3-, AXL- and MER-TK) receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XI RTKs: TAM (TYRO3-, AXL- and MER-TK) receptor family

Overview: Members of this RTK family represented a novel structural motif, when sequenced. The ligands for this family, growth arrest specific protein 6 (*GAS6*, Q14393) and protein S (*PROS1*, P07225), are secreted plasma proteins which undergo vitamin K-dependent post-translational modifications generating carboxyglutamate-rich domains which are able to bind to negatively-charged surfaces of apoptotic cells.

Nomenclature	AXL receptor tyrosine kinase	TYRO3 protein tyrosine kinase	MER proto-oncogene, tyrosine kinase
HGNC, UniProt	AXL, P30530	TYRO3, Q06418	MERTK, Q12866
EC number	2.7.10.1	2.7.10.1	2.7.10.1
Common abbreviation	Axl	Tyro3	Mer
Endogenous ligands	growth arrest specific protein 6 (<i>GAS6</i> , Q14393) [138], protein S (<i>PROS1</i> , P07225) [171]	growth arrest specific protein 6 (<i>GAS6</i> , Q14393) [138], protein S (<i>PROS1</i> , P07225) [171]	growth arrest specific protein 6 (<i>GAS6</i> , Q14393) [138]

Comments: AXL tyrosine kinase inhibitors have been described [131].

Type XII RTKs: TIE family of angiotensin receptors

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XII RTKs: TIE family of angiotensin receptors

Overview: The TIE family were initially associated with formation of blood vessels. Endogenous ligands are angiotensin-1 (*ANGPT1*, Q15389), angiotensin-2 (*ANGPT2*, O15123), and angiotensin-4 (*ANGPT4*, Q9Y264). Angiotensin-2 (*ANGPT2*, O15123) appears to act as an endogenous antagonist of angiotensin-1 function.

Nomenclature	tyrosine kinase with immunoglobulin like and EGF like domains 1	TEK receptor tyrosine kinase
HGNC, UniProt	TIE1, P35590	TEK, Q02763
EC number	2.7.10.1	2.7.10.1
Common abbreviation	TIE1	TIE2
Endogenous ligands	–	angiotensin-1 (<i>ANGPT1</i> , Q15389), angiotensin-4 (<i>ANGPT4</i> , Q9Y264)

Type XIII RTKs: Ephrin receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XIII RTKs: Ephrin receptor family

Overview: Ephrin receptors are a family of 15 RTKs (the largest family of RTKs) with two identified subfamilies (EphA and EphB), which have a role in the regulation of neuronal development, cell migration, patterning and angiogenesis. Their ligands are membrane-associated proteins, thought to be glycosylphosphatidylinositol-linked for EphA (ephrin-A1 (*EFNA1*, P20827), ephrin-A2 (*EFNA2*, O43921), ephrin-A3 (*EFNA3*, P52797), ephrin-A4 (*EFNA4*, P52798) and ephrin-A5 (*EFNA5*, P52803)) and ITM proteins for Ephrin B (*ENSHM00250000002014*: ephrin-B1 (*EFNB1*, P98172), ephrin-B2 (*EFNB2*, P52799) and ephrin-B3 (*EFNB3*, Q15768)), although the relationship between ligands and receptors has been incompletely defined.

Nomenclature	EPH receptor A1	EPH receptor A2	EPH receptor A3	EPH receptor A4	EPH receptor A5	EPH receptor A6	EPH receptor A7

Inhibitors	–	–	compound 66 (p <i>C</i> ₅₀ 9) [95]	–	–	tesevatinib (p <i>C</i> ₅₀ 8.9) [51]	–

Type XIV RTKs: RET

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XIV RTKs: RET

Overview: Ret proto-oncogene (Rearranged during transfection) is a transmembrane tyrosine kinase enzyme which is employed as a signalling partner for members of the GDNF family receptors. Ligand-activated GFR appears to recruit Ret as a dimer, leading to activation of further intracellular signalling pathways. Ret appears to be involved in neural crest development, while mutations may be involved in multiple endocrine neoplasia, Hirschsprung’s disease, and medullary thyroid carcinoma.

Nomenclature	ret proto-oncogene
HGNC, UniProt	RET, P07949
EC number	2.7.10.1
Common abbreviation	Ret
Inhibitors	tamatinib (pIC ₅₀ 8.3) [23], vandetanib (pK _d 7.5) [33]

Comments: A number of tyrosine kinase inhibitors targeting RET have been described [43].

Type XV RTKs: RYK

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XV RTKs: RYK

Overview: The ‘related to tyrosine kinase receptor’ (Ryk) is structurally atypical of the family of RTKs, particularly in the activation and ATP-binding domains. RYK has been suggested to lack kinase activity and appears to be involved, with FZD8, in the Wnt signalling system [152].

Nomenclature	receptor-like tyrosine kinase
HGNC, UniProt	RYK, P34925
EC number	2.7.10.1
Common abbreviation	RYK

Comments: Thus far, no selective RYK inhibitors have been described.

Type XVI RTKs: DDR (collagen receptor) family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XVI RTKs: DDR (collagen receptor) family

Overview: Discoidin domain receptors 1 and 2 (DDR1 and DDR2) are structurally-related membrane protein tyrosine kinases activated by collagen. Collagen is probably the most abundant protein in man, with at least 29 families of genes encoding proteins, which undergo splice variation and post-translational processing, and may exist in monomeric or polymeric forms, producing a triple-stranded, twine-like structure. In man, principal family members include COL1A1 (COL1A1, P02452), COL2A1 (COL2A1, P02458), COL3A1 (COL3A1, P02461) and COL4A1 (COL4A1, P02462).

Nomenclature	discoidin domain receptor tyrosine kinase 1	discoidin domain receptor tyrosine kinase 2
HGNC, UniProt	DDR1, Q08345	DDR2, Q16832
EC number	2.7.10.1	2.7.10.1
Common abbreviation	DDR1	DDR2

Comments: The tyrosine kinase inhibitors of DDR, imatinib and nilotinib, were identified from proteomic analysis [34]. Other collagen receptors include glycoprotein VI (O9HCN6), leukocyte-associated immunoglobulin-like receptor 1 (Q6GTX8), leukocyte-associated immunoglobulin-like receptor 2 (Q6ISS4) and osteoclast-associated immunoglobulin-like receptor (Q81Y55).

Type XVII RTKs: ROS receptors

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XVII RTKs: ROS receptors

Nomenclature	c-ros oncogene 1, receptor tyrosine kinase
HGNC, UniProt	ROS1, P08922
EC number	2.7.10.1
Common abbreviation	ROS

Comments: crizotinib is a tyrosine kinase inhibitor, anti-cancer drug targeting ALK and ROS1.

Type XVIII RTKs: LMR family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XVIII RTKs: LMR family

Overview: The LMR kinases are unusual amongst the RTKs in possessing a short extracellular domain and extended intracellular domain (hence the ‘Lemur’ name reflecting the long tail). A precise function for these receptors has yet to be defined, although LMR1 was identified as a potential marker of apoptosis [48], giving rise to the name AATYK (Apoptosis-associated tyrosine kinase); while over-expression induces differentiation in neuroblastoma cells [155].

Nomenclature	apoptosis associated tyrosine kinase	lemur tyrosine kinase 2	lemur tyrosine kinase 3
HGNC, UniProt	AATK, Q6ZMQ8	LMTK2, Q8IWU2	LMTK3, Q96Q04
EC number	2.7.11.1	2.7.11.1	2.7.11.1
Common abbreviation	Lmr1	Lmr2	Lmr3

Comments: As yet no selective inhibitors of the LMR family have been described.

Type XIX RTKs: Leukocyte tyrosine kinase (LTK) receptor family

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XIX RTKs: Leukocyte tyrosine kinase (LTK) receptor family

Overview: The LTK family appear to lack endogenous ligands. LTK is subject to tissue-specific splice variation, which appears to generate products in distinct subcellular locations. ALK fusions created by gene translocations and rearrangements are associated with many types of cancer, including large cell lymphomas, inflammatory myofibroblastic tumours and non-small cell lung cancer [138].

Nomenclature	leukocyte receptor tyrosine kinase	ALK receptor tyrosine kinase
HGNC, UniProt	LTK, P29376	ALK, Q9UM73
EC number	2.7.10.1	2.7.10.1
Common abbreviation	LTK	ALK
Inhibitors	–	GSK-1838705A (pIC ₅₀ 9.3) [159], compound 8e (pIC ₅₀ 9.1) [74], crizotinib (pIC ₅₀ 9) [30], NVP-TAE684 (pK _d 9) [33], compound 25b (pIC ₅₀ 8.7) [53]
Selective inhibitors	–	ceritinib (pIC ₅₀ 9.7) [120]
Comments	–	crizotinib appears to be a selective ALK inhibitor acting on the tyrosine kinase activity [52]

Type XX RTKs: STYK1

Catalytic receptors → Receptor kinases → TK: Tyrosine kinase → Receptor tyrosine kinases (RTKs) → Type XX RTKs: STYK1

Overview: Similar to the LMR RTK family, STYK1 has a truncated extracellular domain, but also displays a relatively short intracellular tail beyond the split kinase domain. STYK1 (also known as Novel Oncogene with Kinase-domain, NOK) has been suggested to co-localize with activated EGF receptor [38].

Nomenclature	serine/threonine/tyrosine kinase 1
HGNC, UniProt	STYK1, Q6I9G0
EC number	2.7.10.2
Common abbreviation	STYK1

Comments: As yet, no selective inhibitors of STYK1 have been described.

Receptor serine/threonine kinase (RSTK) family

Catalytic receptors → Receptor kinases → TKL: Tyrosine kinase-like → Receptor serine/threonine kinase (RSTK) family

Overview: Receptor serine/threonine kinases (RSTK), of structural similarities. Agonist binding initiates formation of a cell-surface complex of type I and type II RSTK, possibly heterotrimeric, where both subunits express serine/threonine kinase activity. The type I receptor serine/threonine kinases are also known as activin receptors or activin receptor-like kinases, ALKs, for which a systematic nomenclature has been proposed (ALK1-7). The type II protein phosphorylates the kinase domain of the type I partner (sometimes referred to as the signal propagat-

ing subunit), causing displacement of the protein partners, such as the FKBP12 FK506-binding protein *FKBP1A* (P62942) and allowing the binding and phosphorylation of particular members of the Smad family. These migrate to the nucleus and act as complexes to regulate gene transcription. Type III receptors, sometimes called co-receptors or accessory proteins, regulate the signalling of the receptor complex, in either enhancing (for example, presenting the ligand to the receptor) or inhibitory manners. TGFβ family

ligand signalling may be inhibited by endogenous proteins, such as *folistatin* (*FST*, P19883), which binds and neutralizes activins to prevent activation of the target receptors. Endogenous agonists, approximately 30 in man, are often described as paracrine messengers acting close to the source of production. They are characterized by six conserved cysteine residues and are divided into two subfamilies on the basis of sequence comparison and signalling pathways acti-

vated, the TGFβ/activin/nodal subfamily and the BMP/GDF (growth/differentiation factor)/MIS (Müllerian inhibiting substance) subfamily. Ligands active at RSTKs appear to be generated as large precursors which undergo complex maturation processes [103]. Some are known to form disulphide-linked homo- and/or heterodimeric complexes. Thus, inhibins are α subunits linked to a variety of β chains, while activins are combinations of β subunits.

Type I receptor serine/threonine kinases

Catalytic receptors → Receptor kinases → TKL: Tyrosine kinase-like → Receptor serine/threonine kinase (RSTK) family → Type I receptor serine/threonine kinases

Overview: The type I receptor serine/threonine kinases are also known as activin receptors or activin receptor-like kinases, ALKs, for which a systematic nomenclature has been proposed (ALK1-7).

Common abbreviation	TGFB3

RSTK functional heteromers

Catalytic receptors → Receptor kinases → TKL: Tyrosine kinase-like → Receptor serine/threonine kinase (RSTK) family → RSTK functional heteromers

Overview: For the receptors listed on this page, the exact combination of subunits forming the functional heteromeric receptors is unknown.

Nomenclature	Transforming growth factor β receptor		
Subunits	transforming growth factor beta receptor 1 (Type I), transforming growth factor beta receptor 3 (Type III), transforming growth factor beta receptor 2 (Type II)		
Coupling	Smad2, Smad3 [135, 167]		
Endogenous agonists	TGFB1 (<i>TGFB1</i> , P01137), TGFB2 (<i>TGFB2</i> , P61812), TGFB3 (<i>TGFB3</i> , P10600)		
Nomenclature	Bone morphogenetic protein receptors		
Subunits	bone morphogenetic protein receptor type IB (Type I), activin A receptor type 2B (Type II), activin A receptor type 2A (Type II), activin A receptor type 1C (Type I), activin A receptor type 1 (Type I), bone morphogenetic protein receptor type 2 (Type II)		
Coupling	Smad1, Smad5, Smad8 [153, 167]		
Endogenous agonists	BMP-10 (<i>BMP10</i> , O95393), BMP-2 (<i>BMP2</i> , P12643), BMP-4 (<i>BMP4</i> , P12644), BMP-5 (<i>BMP5</i> , P22003), BMP-6 (<i>BMP6</i> , P22004), BMP-7 (<i>BMP7</i> , P18075), BMP-8A (<i>BMP8A</i> , Q7Z5Y6), BMP-8B (<i>BMP8B</i> , P34820), BMP-9 (<i>GDF2</i> , Q9UK05)		
Nomenclature	Growth/differentiation factor receptors		
Subunits	transforming growth factor beta receptor 1 (Type I), bone morphogenetic protein receptor type IB (Type I), activin A receptor type 2B (Type II), activin A receptor type 2A (Type II), activin A receptor type 1C (Type I), bone morphogenetic protein receptor type 1A (Type I), activin A receptor type 1B (Type I), bone morphogenetic protein receptor type 2 (Type II)		
Coupling	Smad1, Smad5, Smad8 [135, 167]		
Endogenous agonists	growth/differentiation factor-1 (<i>GDF1</i> , P27539), growth/differentiation factor-10 (<i>GDF10</i> , P55107), growth/differentiation factor-3 (<i>GDF3</i> , Q9NR23), growth/differentiation factor-7 (<i>GDF7</i> , Q7Z4P5), growth/differentiation factor-9 (<i>GDF9</i> , O60383)		
Coupling	Smad1, Smad5, Smad8 [135, 167]		
Endogenous agonists	activin A (<i>INHBA</i> , P08476), activin AB (<i>INHBA</i> , <i>INHBB</i> , P08476, P09529), activin B (<i>INHBB</i> , P09529), inhibin A (<i>INHAA</i> , <i>INHBA</i> , P05111, P08476)		
Comments	Activin receptors are heteromeric complexes comprising activin receptor type I and type II subunits.		

Comments on Receptor serine/threonine kinase (RSTK) family: A number of endogenous inhibitory ligands have been identified for RSTKs, including BMP-3 (*BMP3*, P12645), inhibin α (*INHAA*, P05111), inhibin β C (*INHBC*, P55103) and inhibin β E (*INHBE*, P58166). An appraisal of small molecule inhibitors of TGF β and BMP signalling concluded that TGF β pathway inhibitors were more selective than BMP signalling inhibitors [187]. The authors confirmed the selectivity of TGF-beta RI inhibitor III to inhibit TGF β signalling through ALK4, ALK5, ALK7 [31].

Dorsomorphin inhibits BMP signalling through ALK2 and ALK3, it also inhibits AMP kinase [207]. **Smads** were identified as mammalian orthologues of Drosophila genes termed "mothers against decapentaplegic" and may be divided into Receptor-regulated Smads (R-Smads, including Smad1, Smad2, Smad3, Smad5 and Smad8), Co-mediated Smad (Co-Smad, Smad4) and Inhibitory Smads (I-Smad, Smad6 and Smad7). R-Smads form heteromeric complexes with Co-Smad. I-Smads compete for binding of R-Smad with both receptors and Co-Smad.

Nomenclature	HGNC gene symbol	Uniprot ID	Other names
Smad1	<i>SMAD1</i>	Q15797	JV4-1, MADH1, MADR1
Smad2	<i>SMAD2</i>	Q15796	JV18-1, MADH2, MADR2
Smad3	<i>SMAD3</i>	P84022	HsT17436, JV15-2, MADH3
Smad4	<i>SMAD4</i>	Q13485	DPC4, MADH4
Smad5	<i>SMAD5</i>	Q99717	Dwfc, JVS-1, MADH5
Smad6	<i>SMAD6</i>	O43541	HsT17432, MADH6, MADH7
Smad7	<i>SMAD7</i>	O15105	MADH7, MADH8
Smad8	<i>SMAD9</i>	O15198	MADH6, MADH9

Receptor tyrosine phosphatase (RTP) family

Catalytic receptors → Receptor tyrosine phosphatase (RTP) family

Overview: Receptor tyrosine phosphatases (RTP) are cell-surface proteins with a single TM region and intracellular phosphotyrosine phosphatase activity. Many family members exhibit constitutive activity in heterologous expression, dephosphorylating intracellular targets such as Src tyrosine kinase (SRC) to activate signalling cascades. Family members bind components of the extracellular matrix or cell-surface proteins indicating a role in intercellular communication.

Nomenclature	RTP Type A	RTP Type B	RTP Type C	RTP Type D	RTP Type E	RTP Type F	RTP Type G
HGNC, UniProt	<i>PTPR</i> A, P18433	<i>PTPR</i> B, P23467	<i>PTPR</i> C, P08575	<i>PTPR</i> D, P23468	<i>PTPR</i> E, P23469	<i>PTPR</i> F, P10586	<i>PTPR</i> G, P23470

Tumour necrosis factor (TNF) receptor family

Catalytic receptors → Tumour necrosis factor (TNF) receptor family

Overview: The TNF receptor superfamily (TNFRSF, provisional nomenclature) displays limited homology beyond an extracellular domain rich in cysteine residues and is activated by at least 18 different human homologues of TNF referred to as the TNF superfamily (TNFSF). Some homologues lacking transmembrane and cytoplasmic domains function as decoy receptors binding ligand and without inducing cell signalling. Many of these receptors and ligands function as multimeric entities. Signalling through these receptors is complex and involves interaction with cytoplasmic adaptor proteins (such as TRADD and TRAF1). Several of these receptors contain cytoplasmic motifs known as ‘death domains’, which upon activation serve to recruit death domain- and death effector domain-containing proteins crucial for the initiation of an apoptotic response. Additional signalling pathways include the regulation of the nuclear factor κ B or mitogen-activated protein kinase pathways. Pharmacological manipulation of these receptors is mainly enacted through chelating the endogenous agonists with humanised monoclonal antibodies (e.g. *Infliximab* or *adalimumab*) or recombinant fusion proteins of IgG and soluble receptors (e.g. *etanercept*). Some mutated forms of TNF ligands are capable of selecting for different receptor subtypes.

Nomenclature	tumor necrosis factor receptor 1	tumor necrosis factor receptor 2	lymphotoxin β receptor	OX40	CD40	Fas	decoy receptor 3

Endogenous ligands	RANK ligand (TNFSF11, O14788)	–	TL1A (TNFSF15, Q9S150)	TWEAK (TNFSF12, O43508)	APRIL (TNFSF13, O75888), BAFF (TNFSF13B, Q9Y275)	BAFF (TNFSF13B, Q9Y275)	B and T lymphocyte attenuator (BTLA, Q7Z6A9), LIGHT (TNFSF14, O43557), lymphotoxin-α (LTA, P01374)

(continued)							
Nomenclature	receptor activator of NF-kappa B	osteoprotegerin	death receptor 3	TWEAK receptor	TACI	BAFF receptor	herpes virus entry mediator
Comments	-	Acts as a decoy receptor for RANK ligand (<i>TNFSF11</i> , O14788) and possibly for TRAIL (<i>TNFSF10</i> , P50591).	The only known TNFSF ligand for DR3 is TNF-like protein 1A (TL1A) [218].	-	-	-	-

Nomenclature	nerve growth factor receptor	B cell maturation antigen	glucocorticoid-induced TNF receptor	toxicity and JNK inducer	REL τ	death receptor 6
Systematic nomenclature	TNFRSF16	TNFRSF17	TNFRSF18	TNFRSF19	TNFRSF19L	TNFRSF21
HGNC, UniProt	<i>NGFR</i> , P08138	<i>TNFRSF17</i> , Q02223	<i>TNFRSF18</i> , Q9YSU5	<i>TNFRSF19</i> , Q9NS68	<i>RELτ</i> , Q969Z4	<i>TNFRSF21</i> , O75509
Adaptor proteins	TRAF2, TRAF4, TRAF6	TRAF1, TRAF2, TRAF3, TRAF5, TRAF6	TRAF1, TRAF2, TRAF3, TRAF5, SIVA	TRAF1, TRAF2, TRAF3, TRAF5	TRAF1	TRADD
Common abbreviation	–	BCMA	GITR	TAI	–	DR6
Endogenous ligands	NGF (<i>NGF</i> , P01138) [pI _{C50} 6] [97], BDNF (<i>BDNF</i> , P23560), neurotrophin-3 (<i>NTF3</i> , P20783), neurotrophin-4 (<i>NTF4</i> , P34130)	APRIL (<i>TNFSF13</i> , O75888), BAFF (<i>TNFSF13B</i> , Q9Y275)	TL6 (<i>TNFSF18</i> , Q9UNG2)	lymphotoxin- α (<i>LTA</i> , P01374)	–	–
Comments	One of the two receptor types for the neurotrophins (factors that stimulate neuronal cell survival and differentiation). The other family of neurotrophin receptors are the Trk family of receptor tyrosine kinases.	–	–	Believed to be essential during embryonic development.	Abundant in hematologic tissues. Selective receptor for TNF receptor-associated factor 1 (TRAF1). Activates the NF- κ B pathway.	–

Nomenclature	TNFRSF22	TNFRSF23	ectodysplasin A2 isoform receptor	ectodysplasin 1, anhidrotic receptor
Systematic nomenclature	–	–	TNFRS27	–
HGNC, UniProt	–	–	EDA2R, Q9HAV5	EDAR, Q9UNEO
Adaptor proteins	–	–	TRAF1, TRAF3, TRAF6	TRAF1, TRAF2, TRAF3
Endogenous ligands	–	–	ectodysplasin A2 (EDA, Q92838) [201]	ectodysplasin A1 (EDA, Q92838) [201]
Comments	Only identified in mouse to date. A potential decoy receptor for the cytotoxic ligand TNFSF10/TRAIL. Does not contain a cytoplasmic death domain so does not induce apoptosis, and does not activate the NF-κB signalling pathway.	Only identified in mouse to date. A potential decoy receptor for the cytotoxic ligand TNFSF10/TRAIL. Does not contain a cytoplasmic death domain so does not induce apoptosis, and does not activate the NF-κB signalling pathway.	Receptor for the EDA-A2 isoform of ectodysplasin encoded by the anhidrotic ectodermal dysplasia (EDA) gene.	Cell surface receptor for ectodysplasin A (a morphogen involved in the development of ectodermal tissues, including skin, hair, nails, teeth, and sweat glands).

Comments: TNFRSF1A is preferentially activated by the shed form of TNF ligand, whereas the membrane-bound form of TNF serves to activate TNFRSF1A and TNFRSF1B equally. The neurotrophins nerve growth factor (NGF (NGF, P01338)), brain-derived neurotrophic factor (BDNF (BDNF, P23560)), neurotrophin-3 (NTF3, P20783) and neurotrophin-4 (NTF4, P34130) (NTF4) are structurally unrelated to the TNF ligand and superfamily but exert some of their actions through the low affinity nerve growth factor receptor (NGFR (TNFRSF16)) as well as through the TRK family of receptor tyrosine kinases. The endogenous ligands for EDAR and EDA2R are, respectively, the membrane (Q92838[1-391]) and secreted (Q92838[1.60-391]) isoforms of Ectodysplasin-A (EDA, Q92838).
